

ADDENDUM

Certain versions of ActiveReports Designer may require additional steps for proper formatting and output. Contact your Mastercam Reseller for any updates.

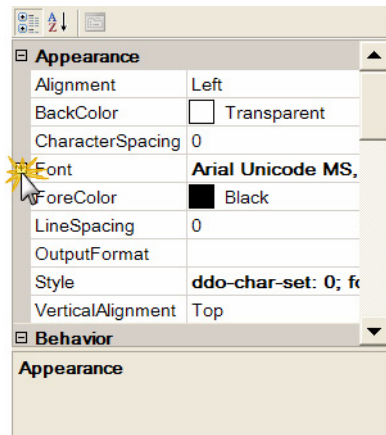

Overriding Automatic Font Re-sizing

The ActiveReports Designer may automatically increase or decrease your selected font size. This can cause unexpected formatting results. Use the following procedure to override this.

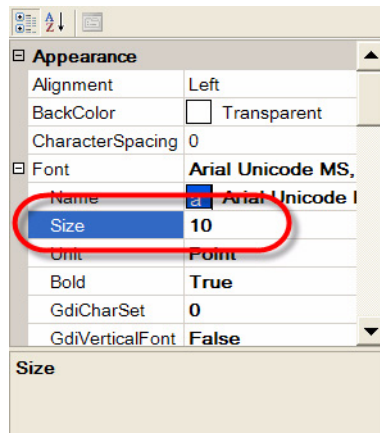

- 1 Select the control.

- 2 Expand the **Font** property in the Appearance section of the Properties Grid.

- 3 Type the correct font size into the **Size** field and press [Enter].

- 4 Save the file and exit the ActiveReports Designer.

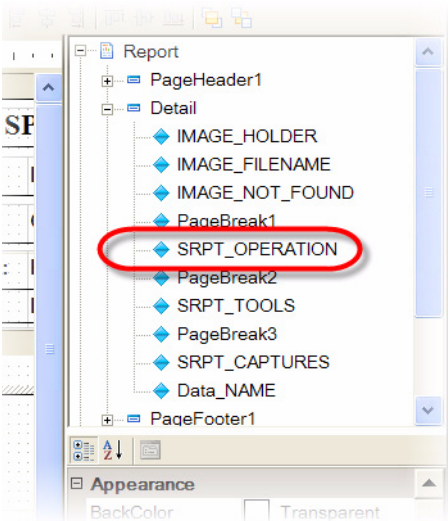

Halting the Parser

When you assign the custom template to a setup sheet generated from Mastercam, an issue with the X4 MU1 parser may prevent Mastercam from writing data from a nested subreport to the XML file. In the tutorial, this means that operation and tool data that is supplied by the operation subreport -*TINMAN Setup Sheet (MILL-OPERATION).rpx* may be missing when you generate the setup sheet in Lesson 6. Use the following procedure to correct this.

- 1 Open the main report file: *TUTORIAL SETUP SHEET (MILL).rpx*.

If you saved your main report under a different name, open that file.

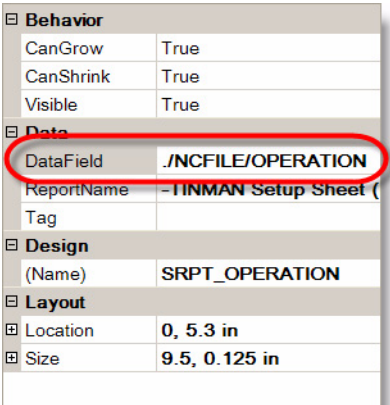

- 2 From the Report Explorer, expand the **Detail** section and select **SRPT_OPERATION**.

- 3 Add[./] to the beginning of the path expression in the DataField property.

Your expression should now read:
./NCFILE/OPERATION (As shown in the image to the right.)

Note: The command ./ halts the parser so that Mastercam can write nested subreport data to the XML file.

- 4 Save the file and exit the ActiveReports Designer.
